- open source
- high performance
- document oriented database

I What are Commands?

Commands are special MongoDB operations that are executed by running a query against a collection. Most drivers provide a helper for running commands. Here is an example of how to run the dropDatabase command

```
use(database:1));
```

Commands must be run on the admin database and must be preceded with an asterisk

powered by
mongoDB

```
{dist:  
key: key[,query:]
```

```
{drop: coll}
```

```
{drop: --
```
